

Glicron

Feature	Benefit
Glicron Protects human Pancreatic beta cell from hyperglycemia induced apoptosis	Safe for long term use
Gliclazide has azabicyclo ring in it's structure, which is unique among the sulfonylureas.	Only sulfonylureas that shows antiplatelet and antioxidant activity independent of its effects on glycemic control
Gliclazide selectively binds to sulfonylurea receptors (SUR-1) on the surface of the pancreatic beta-cells	Thus provides cardiovascular protection as it does not bind to sulfonylurea receptors (SUR-2A) in the heart.
